

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

PINE GROSBEAK AT YOUNGSTOWN, OHIO.

On February 15, 1916, while at the residence of Mrs. C. E. Felton, Cohasset Road, near the edge of Mill Creek Park, I observed a Pine Grosbeak feeding on the lawn. The same morning I saw two of the same species feeding on hawthorne buds in another locality of the park.

The individual Pine Grosbeak has remained in the vicinity of Mrs. Felton's home up to the present date. It may be interesting to know that upon investigation we learned it was feeding on ash seeds, which had blown on to the lawn from ash trees located in the park. It also feeds on apple buds.

This is our first definite record of the Pine Grosbeak for the vicinity of Youngstown.

GEORGE L. FORDYCE.

Youngstown, Ohio.

THE KENTUCKY WARBLER AT SALEM, OHIO.

A year ago I had an article in this magazine on the "Kentucky Warbler in Northern Columbiana County." Perhaps some of my readers imagined that this station was the only place in the county where the bird was to be found; and I thought so myself. And so far as the reports of the Biological Survey show, this is the only station in northeastern Ohio where it is found breeding.

This year (1915) was the third season that I had found a breeding pair in the same woodland, and so far the only place near home where they have been found.

But after this summer's experience and reports I do not think that the Kentucky Warbler is so very rare in this county, although it is still uncommon. In early June, Mr. J. F. Machwart, a Salem high school teacher and bird student, found a pair at Shelton's Grove, a local picnic ground five miles south of Salem. And about the same time Mr. Volney Rogers, a Youngstown bird student, found a bird on his brother's farm some miles east of here near the state line. And on the fifth of July I spent part of the day at Round Knob, five miles north of Wellsville, the highest point (1447 feet) in the county. While exploring an oak wood on one of its slopes I was greeted by the familiar alarm-notes of a Kentucky, but I failed to get sight of the bird. And a couple of hours later, when homeward bound and on the opposite side of the mount in a dense thicket that bordered a drainage "run" I again heard the familiar notes and was rewarded by getting a momentary glimpse of a Kentucky Warbler; and more, for there were two birds. The second, however, had no markings of black on face or head and I concluded that it was one of the young from this season's brood.
